

ABSTRACT OF THE DISCLOSURE

An automatic photograph producer and an operating method of the producer. The automatic photograph producer is incorporated into a four-in-one multi-function machine that includes a printer, a scanner, a photocopier and a facsimile. The automatic photograph producer comprises a platform, a top panel, a penetrating light source and a printer. The platform is a place for holding transparencies. One end of the top panel couples with one end of the platform. The penetrating light source is above the top panel for sending light to the transparency on the platform during scanning. The printer prints out an image of the scanned transparency onto a photographic paper.
